

AME 294 · Topic: Creating Games with AI

A TYPING GAME

Babysitter

Type the buzz. Save the nap.

Ying-Ju Chen

THE IDEA

It started with a typo

打蚊子

dǎ wénzi · swatting mosquitoes

≈

打文字

dǎ wénzì · typing words

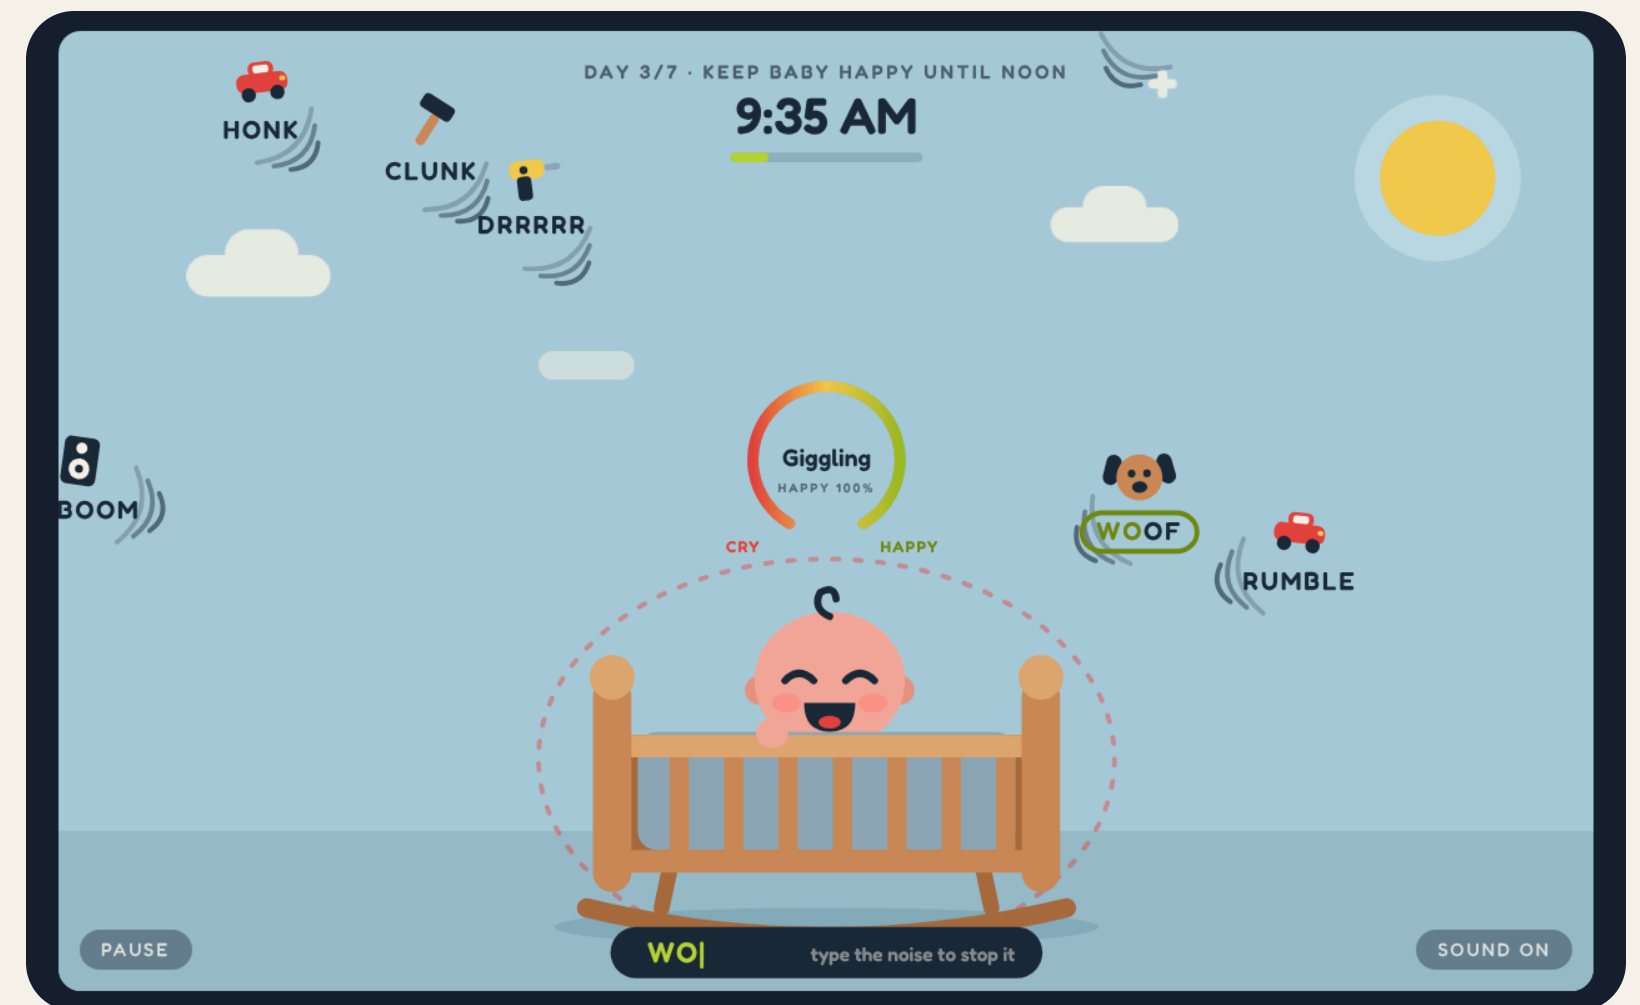

In Chinese they sound almost the same. So in this game, **typing is how you swat**.

HOW IT PLAYS

Night, then day, for seven days

Night: type the buzz to keep the baby asleep

Day: type the noise to keep the baby laughing

GAME MECHANICS

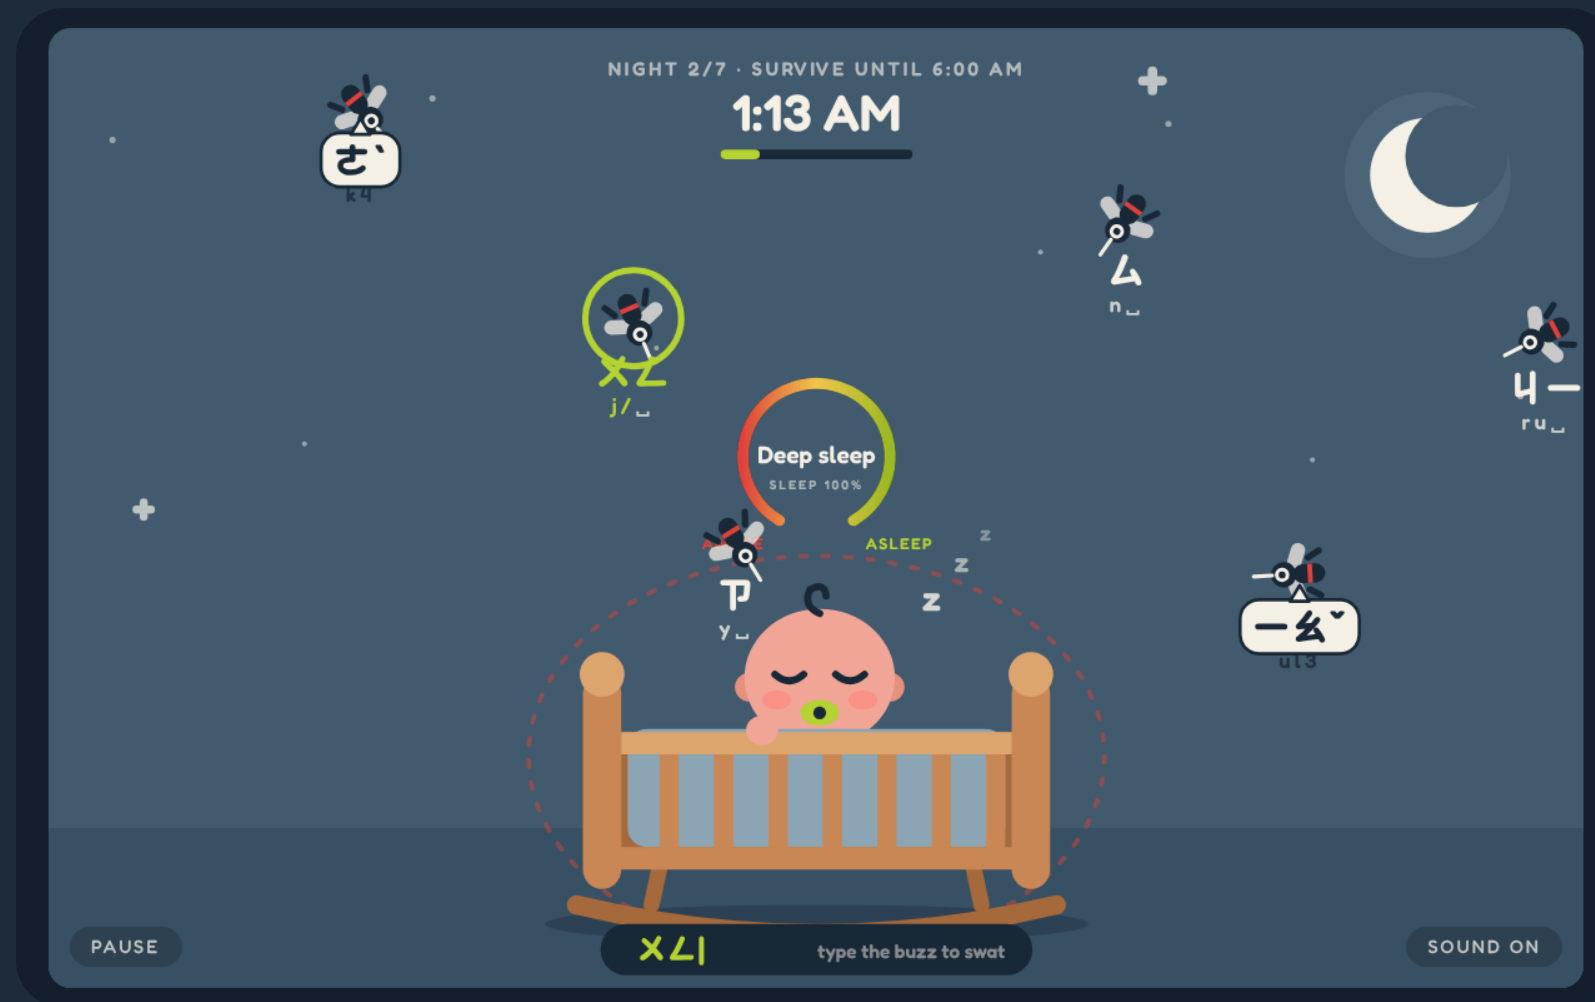

A new pest every night and every day

ROUND	NIGHT: NEW PEST	DAY: NEW NOISE
1	 Mosquito: type its buzz (bzz, zing)	 Noises: honk, woof, bang
2	 Tiger mosquito: big, slow, two buzzes	 Jackhammer: three noises in a row
3	 Zippy mosquito: tiny, fast, wobbly	 Neighbor's dog: then two puppies
4	 Shadow mosquito: its buzz fades away	 Doorbell: rings right by the crib
5	 Fly: hovers, then darts	 Mail carrier: each ring costs 2%
6	 Cockroach: two scurry along the floor	 Garbage truck: stop its song in time
7	 Mouse: lock on and it panics and runs	 Ice cream truck: kids run out yelling

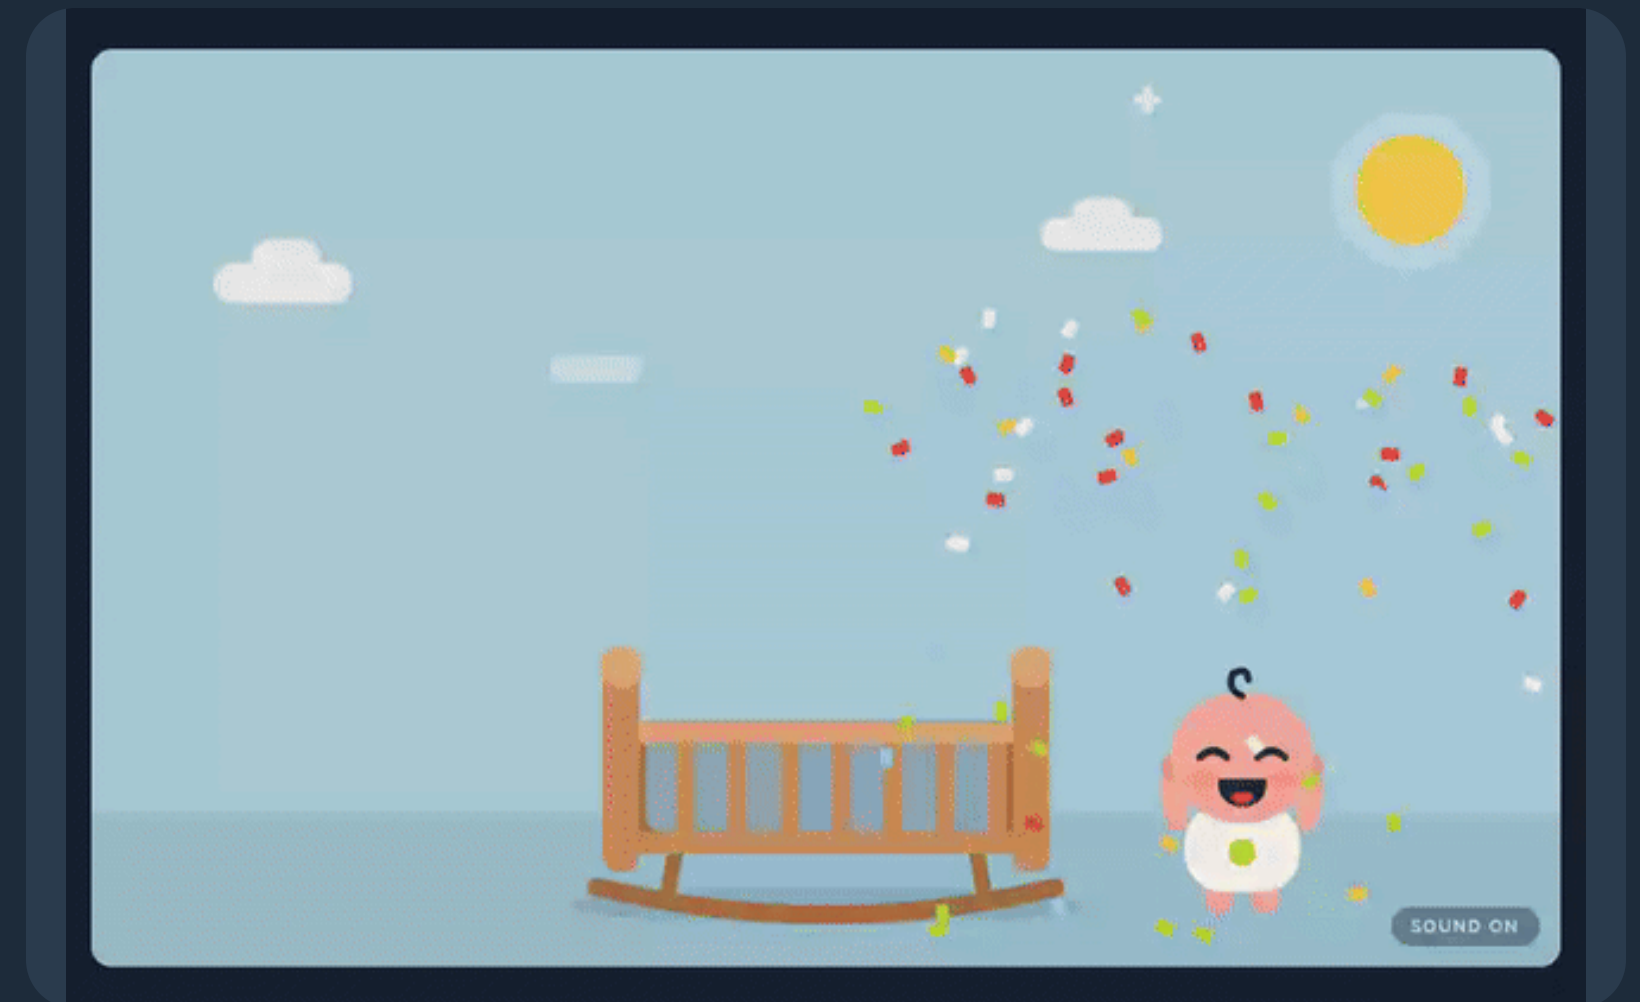

From night 2, some mosquitoes talk ("snack", "getup"). Each round is faster and busier.

TWO EXTRAS

A Zhuyin challenge and a happy ending

注音 Zhuyin mode: type with a real Zhuyin input method, or just press the keys shown under each word

The ending: survive day 7 and the baby climbs out of the crib, then you get the certificate. [Watch the animation](#)

MY PROCESS

Five days, one conversation with Claude

OCT 3

Concept

Idea, mockups, flat art style

OCT 3–5

Build

Night/day loop, enemies, scoring, ending

OCT 6

Sound

Music and effects from ElevenLabs

OCT 6

Balance

A typing bot plays to the end

OCT 7

Ship

Results screen, GitHub, itch.io

Tools: Claude for code, art and testing · ElevenLabs for music and sound effects

WHO DECIDED WHAT

I directed, Claude built and suggested

My ideas

- The pun and the mechanic: type to SWAT
- Day levels with noises and a laughing baby
- New enemy each round, 7 days, certificate
- Zhuyin mode for Taiwanese players
- Art style (my reference) and all the sounds
- The difficulty goal and results-screen layout

Claude's ideas

- Code structure, all numbers in one config
- Lock-on typing and the ring sleep meter
- First draft of enemies (I edited it)
- A typing bot to test the difficulty
- Rivals and titles, no online leaderboard
- Report-card stamp look; 40 s music loop

When Claude suggested something, it gave me options. I chose, then reviewed every screen.

WHAT CHANGED

Four problems, four fixes

Nobody could win

The bot lost on night 7 even at 9 perfect keys per second. We capped the spawns: now a fast typist wins about 3 runs in 4.

The slap sound

Six rounds, because the AI can't hear. It built listening pages and I picked the softest, most cartoonish one by ear.

No leaderboard online

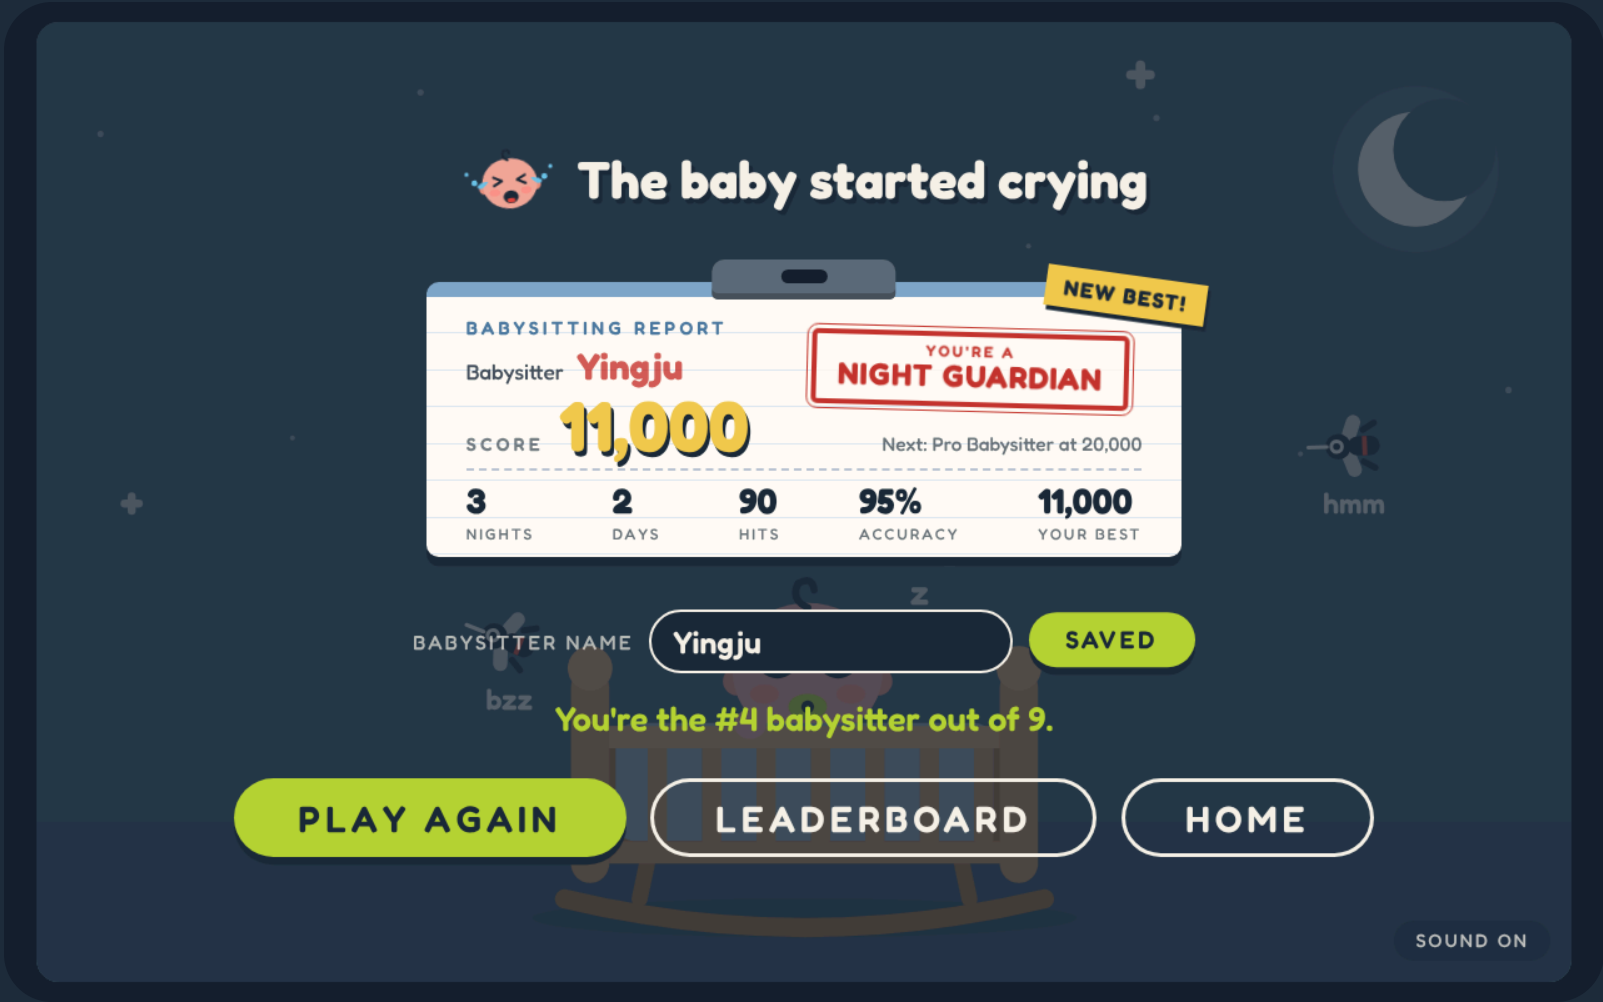

GitHub Pages has no server, and I didn't want logins. Scores stay on your device, ranked against 7 made-up rivals.

Music felt stuck

The clip was only 10 seconds. Claude rearranged it into a 40-second loop that starts on the title screen.

RESULTS SCREEN

Same paper style, two different moments

Lose: a clipboard report with a red rubber stamp

Win: a certificate with a gold frame and round seal

WHAT I LEARNED

AI is fast. Taste is still my job.

Where AI helped most

- Ideas became playable in minutes
- It tested what I couldn't, like full runs
- Tables of levels kept the design organized

Where I had to steer

- It can't hear, so sound was my call
- Its guesses caused bugs, like lost scores
- Cute, balanced, readable: judged by me

**I came up with the ideas and judged the results.
That let me spend my time on creativity.**

Thank you!

Try to become a Super Nanny.
